

Team, I want everyone focused for two minutes.

We have a single day.

That means our success depends entirely on **what we choose to build**, not how much we build.

Most teams will build tools for individuals — productivity apps, trackers, helpers.

Those ideas are fine, but they are common, expected, and easy to forget.

What we're building is different.

Our idea is called **Decision Debt**.

Companies already measure technical debt in code.

What they don't measure is the cost of **indecision**:

- decisions that change
- decisions that are delayed
- decisions that go in circles

That's where time, money, and momentum are lost — quietly.

Our product makes that loss **visible**.

We don't track people.

We don't judge performance.

We track **decision events** inside a project and translate them into a simple signal:

clarity or risk.

This is not a student tool.

It's something a manager immediately understands.

Why this matters for the hackathon:

When the jury sees this, they don't see features.

They see **business value**.

They see something that could actually be used inside a company.

That alone puts us in a different category.

Execution will be simple, clean, and focused.

No overengineering.

No distractions.

If we do this well, we won't just demo an app —
we'll demonstrate **how organizations lose money**, and how we expose it.

That's the idea.
That's the direction.

If we're aligned, we move fast and we move together.

This is **very important**.
Everyone knows what they own.

Me

Responsibility:

- Final decisions
 - Product logic
 - Decision Debt scoring rules
 - Pitch & story
-

Backend Developer — System Builder

Responsibility:

- API
- Project creation
- Decision event logging
- Debt score calculation

Focus:

- Clean endpoints
 - Simple logic
 - Working demo > perfect code
-

Frontend Developer — Experience & Clarity

Responsibility:

- Dashboard UI

- Project view
- Decision Debt visualization

Focus:

- Minimal
- Corporate
- Easy to understand in 10 seconds

No fancy animations.

Data / Logic Person —

Responsibility:

- Define point system
- Translate events → risk
- Write short explanations shown to user

This is where intelligence shows.

Pitch Support / QA — Stability & Story

Responsibility:

- Test flows
- Catch bugs
- Help rehearse demo
- Prepare example data

They make sure nothing breaks on stage.

3 ONE RULE THAT MAKES YOU WIN

You do **ONE FLOW** perfectly:

Create project →
 Log 2 decision changes →
 Show debt increase →
 Explain cost.

That's it.

Clarity > quantity.
